

# Anthony L. Brown

AI Application Developer | Field Service Engineer | Electro-Mechanical Systems Technician  
Portland, OR ■ 971-514-4177 ■ brownanan@icloud.com

6/3/2026

Dear Hiring Manager:

The attached resume describes what I have built. This letter explains how I work and why the two unusual halves of my background fit together.

The first half is twenty-two years of precision electro-mechanical systems work — U.S. Navy AEGIS Combat System and CIWS Phalanx maintenance through 2005, then a twelve-year tenure on 300mm CMP polishers at IM Flash Technologies, followed by qualification and field-service roles at Applied Materials, Axus Technology, and (currently) WGNSTAR contracted to Intel. The discipline that keeps CMP functional and precise is the standard I have learned and applied throughout my semiconductor and post-military technical experience.

The second half, since 2024, is the design and direction of an AI-assisted full-stack software platform that I have shipped into live operation against my own capital. **I do not write production code myself.** I direct AI partners — primarily Claude Code — through the build. I improvise the verification methodology, intuit the architecture, draft the standards before formal frameworks are imposed, and translate cross-domain concepts into enforceable rules that the AI then implements. The platform, an accumulation-trading system built on a tactical, visually-derived methodology I call the Harvest-Fold Cycle, has run on a real Coinbase brokerage account across a fifty-day window with more than two thousand executed trades and price-discipline patterns consistent with the simulated baseline. I have, for necessary reasons, had the entire AI-assisted software development process recorded into a development chronicle which provides additional proof and detailed information regarding my thought processes. Lastly, I should note that the concepts now embedded in aforementioned application have been in manual-trade-based development and testing since 2017.

The two halves connect. Statistical Process Control from the semiconductor floor inspired one of my algorithmic-trading inventions. Semiconductor metrology became the visual framework for a reliability-targeting index inside the governance harness I built for AI co-development. Root-cause analysis on physical equipment became a similar skill as root-cause analysis on AI-generated code after I implemented error logs and other analytical tools. The pattern that keeps showing up: I take what I have learned in one domain and re-cast it as the abstract structure of a problem in another.

**What I do well:** improvise tooling under uncertainty, intuit the standards a system should be measured against before formal frameworks are imposed, and translate intent across the boundary between human judgment and AI execution. **What I do not do:** write production code from a blank page. I am not the right hire for an old-school individual-contributor coding seat. I am the right hire for a role that needs someone to architect, direct, and verify AI-augmented work — or for a hybrid role that bridges electro-mechanical depth and modern AI-direction.

I would welcome the opportunity to discuss how this background fits a specific aspect of the company or role that interests you. I am available at 971-514-4177 or brownanan@icloud.com.

Sincerely,

Anthony L. Brown
